Transport in Cells ...**

Passive transport is basically along the concentration gradient, and is mostly dependent on the permeability of the cell membrane structure.

Active transport requires energy for its execution because the movement of substances is usually against the concentration gradient, due to which, it has to

Active And Passive Transport

Difference and Comparison ...

Differences: Passive Transport (or Diffusion) moves ions from high concentration to low, using no metabolic energy. Active Transport moves ions from low concentration to high, using metabolic energy in the form of ATP. Both use ion channels to move ions across the cell membrane, in or out of the cell.
